Dear Ten Square Games team,

I am applying for the Junior Data Scientist position. I am a student of Robotics and Process Automation at Wrocław University of Science and Technology (five of seven semesters completed) and of IT systems at WSB Merito, and I have worked as a junior IT administrator in a hospital since June 2025.

What I can show for this role is in my own projects. For two years I have worked with event-level market data in Python: building data pipelines in Polars and Parquet, designing features and labels, and checking results with walk-forward validation and causality checks so that nothing leaks from the future. That research ended with the conclusion that there was no tradable edge, and I kept the evaluation toolkit. In JobHunter I pull data from external sources, validate it against JSON schemas and store it in PostgreSQL, with unclear records going to a human review step. I write SQL and read database schemas every week.

I want to be direct about the gaps. I have no commercial experience in data science, I have not worked with a game's analytics data, and my statistics comes from my engineering courses and my own work, not from a dedicated programme. I would like to close that gap on a team that works with real player data, with mentoring from more experienced analysts.

My CV and code are linked above and I am happy to go through any of it in an interview, including my availability around my studies.

Kind regards,
Denis Gruszkiewicz
